

[IntroLab]

Introduction Lab

Introduction: In this lab exercise we check-out our CASE study source code for the course.

Objectives:

- Getting started with Maven
- Getting started with GitHub workflow.

Classwork:

- Each Team creates a GitHub fork of the project repository [JHotDraw].
- In future lab exercises, each team member follow [GitHub flow] to collaborate on projects. That is, each member works on their own feature branch.
- Install the [Maven build system] 3.8.x based on JDK11.
- Goto to the project root folder and run the following Maven command:
`mvn clean install -DskipTests`
- Execute

`mvn exec:java "-Dexec.mainClass=org.jhotdraw.samples.svg.Main"`

at `jhotdraw-samples-misc` folder level via the terminal.
- The JHotDraw software should now be showing a GUI.
