

[CLLab]

Concept Location Lab

Introduction: Dynamic program analysis is the analysis of computer software that is performed by executing programs on a real or virtual processor. For dynamic program analysis to be effective, the target program must be executed with sufficient test inputs to produce interesting behavior. Use of software testing measures such as code coverage helps ensure that an adequate slice of the program's set of possible behaviors has been observed

Objectives:

- Apply the IDE Debugger to locate feature concepts at runtime.
- Create a list of initial set of classes of the concept location results.

Classwork:

- Use the *IDE Debugger* to localize the classes that involves your *Change Request*. Features are often started from the controller classes. Note, if your feature involves a large number of classes then localize only the domain classes that are related to the to domain concepts.

Portfolio Work:

- Write the initial set of classes in table format as a result of your concept location based on your selected feature. The table format is as below:

Domain Class	Responsibility
