## Behavior Driven Testing

### Introduction – User Stories and BDD

User stories are short and simple descriptions of capabilities written from the perspective of the person who desires the new capability. “As a [user type], I want [some goal] so that [some reason].” An alternative includes: “As a [user type], I want [some goal] because [why].”

#### Mapping User Stories to BDD:

| User story                                                                                           | BDD scenario                                                                                                                                           |
|------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| As a calculator user, I want to add two numbers so that I can do addition.                           | <b>Given</b> I have two numbers 500 & 500<br><b>When</b> I add them up<br><b>Then</b> I should get result 1000                                         |
| As a Math teacher, I want to automate marks sorting process so that I can declare top 5 in my class. | <b>Given</b> a list of numbers<br><b>When</b> I sort the list<br><b>Then</b> the list will be in numerical order                                       |
| As a QA engineer, I want to check a critical feature so that I can do smoke test easily.             | <b>Given</b> I visit Google.com<br><b>When</b> I type 'TestingWhiz' as a search string<br><b>Then</b> I should get search results matching TestingWhiz |

Figure 1: Example of how to map User Story to BDD scenario.

#### Portfolio:

- Map your User Stories to BDD Given-When-Then Scenarios
- Use [JGiven] to automate your BDD Scenarios
- For domain specific assertions use the [AssertJ library].  
For Swing applications use the [AssertJ-swing] to automate the Scenarios.
