

1. On VM Edit, change some basic settings

System -> Standard PC (i440X ...)

QEMU -> uncheck "UEFI Boot"

2. On UTM, do below

View -> Custom Toolbar -> add "Send Key" to the VM (=Metasploitable 3)'s toolbar
Edit to add "Ctrl + Shift + Esc". There should be Ctrl +Alt + Delete already. If not, add this, too.

3. Let's login by starting the VM of Metasploitable 3

Send "Ctrl + Alt + Delete" from the tool button, and login

You will see a blue screen saying "Windows License is expired".

Send "Ctrl + Shift + Esc" to open task manager. <- This may take time

File -> New Task (Run...) -> Put "cmd" to open the command prompt

Note: If mouse cursor is stuck in VM, push Ctrl + option to escape.

Note: If you see another blue screen with messages, restart VM and do step 3 again.

4. Delete the files that are causing the crash

In the command prompt, delete VBox related files as putting the following 4 commands:

```
del C:\Windows\System32\drivers\VBoxMouse.sys
```

```
del C:\Windows\System32\drivers\VBoxGuest.sys
```

```
del C:\Windows\System32\drivers\VBoxSF.sys
```

```
del C:\Windows\System32\drivers\VBoxVideo.sys
```

```
rmdir /s /q "C:\Program Files\Oracle\VirtualBox Guest Additions"
```

Note: Now, VBoxMouse.sys maybe keep causing crash and you might be seeing the blue screen with messages againbut be patient and try to finish the above deletion again (and again).

5. Reopen the VM. Now, you can't use the mouse (or touchpad) but, at least the Metasploitable 3 is running stably. You can use the Windows only via keyboard.

6. Open the command prompt and check the ip address...same procedure as in pdf.

Note: Even if the Metasploitable 3 is a blue screen with "Windows License is expired", I think it is okay for lab exercise use. In that case, you can check its IP address from Kali Linux by ""sudo arp-scan -I". In default, the IP address would be something like 192.168.64.10.

Memo: In my case, I can see a black screen with "Windows License is expired" with windows icons after few minutes.
